

CHRISTIAN SARRAN

SENIOR FULL-STACK SOFTWARE DEVELOPER

christian.k.sarran@gmail.com · linkedin.com/in/christian-sarran-290290140 · github.com/Chris034

Senior full-stack developer with 5+ years building enterprise CRM, business-process automation, and data-intensive applications. I translate complex business requirements into production systems with C#/.NET, React, TypeScript, and Azure, and own delivery from technical design through production support.

SKILLS

Backend & APIs	C#, .NET, REST API integration, GraphQL, Java
Frontend	React, TypeScript, JavaScript, HTML, CSS, Fluent UI, responsive and accessible UI
Azure & integration	Azure Functions, Queues, Key Vault, serverless and event-driven architecture
Enterprise platforms	Dynamics 365 (CRM, Field Service), Power Platform, PCF controls, Dataverse Web API, plugins and custom actions
State & data	TanStack Query, Zustand, SQL, Oracle SQL
Testing & quality	Vitest, React Testing Library, Playwright, Storybook, Selenium
Delivery	Solution architecture, requirements analysis, Agile delivery, technical ownership, AI-assisted development, mentoring

EXPERIENCE

Hitachi Solutions — Senior Software Developer Consultant

June 2022 – Present

- Recipient of the annual **Rising Star Award** for consistently exceptional delivery and client feedback across multiple engagements.
- Architect and deliver C#/.NET services, React and TypeScript interfaces, Dynamics 365 customizations, and Azure integrations for enterprise clients.
- Extend Dynamics 365 with plugins, custom actions, console applications, web resources, and PCF controls tailored to client-specific business processes.
- Build serverless, event-driven integrations with external APIs using Azure Functions, Queues, and Key Vault.
- Own features end to end — requirements, technical design, task decomposition, implementation, stakeholder demonstrations, and production support — delivering under strict deadlines with consistently strong CSAT scores.
- Introduced AI-driven development workflows, including context files and environment schema definitions, improving code-generation accuracy, consistency, and developer productivity.
- Mentor developers, promote engineering best practices, and lead front-end architecture decisions across cross-functional Agile teams.

John Deere (*staff augmentation*) — Full-stack developer on a large-scale enterprise Dynamics 365 application in production across 12+ legal entities and 100+ locations, supporting thousands of daily users.

- Built **Unified Job Search**, a React 19/TypeScript application that unifies service-job search across five internal and third-party data sources, replacing a legacy single-source tool. Architected a pluggable source-strategy registry so new sources are added without changes to UI, store, or orchestration layers, and implemented composite priority-paginated infinite search fusing cursor-based and page-based backends into one ranked grid. Integrated six typed Dataverse service actions covering job and checklist detail retrieval, part suggestions, and an ML-based labor-hours estimator, plus a full submission pipeline with per-job error isolation. Maintained a 120+ test Vitest suite.
- Built **Work Order Segment Review**, a work-in-progress review application giving service managers a single screen to review, edit, and price every segment of a work order, replacing multiple legacy form-based controls. Designed a master-detail architecture pairing a segment grid with persisted, user-customizable column layouts above Labor, Parts, Pricing, Notes, and Documents tabs. Re-engineered complex pricing logic to feature parity with the legacy control while coexisting with its server-side plugins, and built a Zustand pending-edit buffer so unsaved edits survive tab and segment switches. Integrated 10+ backend service modules behind a typed web-API layer in a ~300-file codebase.
- Developed custom invoicing and time-tracking UI components and integrations with external John Deere services; contributed to a multi-tenant Azure-based integration platform.
- Led a flagship UI redesign, owning architectural decisions, task decomposition, and delivery execution, and shipped high-priority conference features under tight deadlines.

Microsoft (*staff augmentation*) — Redesigned and refactored the legacy Dynamics 365 Field Service Schedule Board in React — the dispatcher workspace for resource availability, bookings, and work-order assignment. Modernized the UI while improving accessibility and localization for a worldwide audience.

GlobalFoundries — Led requirements analysis, solution architecture, and development of a manufacturing forecasting framework integrated with existing business applications, enabling sales teams to produce better-informed estimates and timelines while forecasting chip production schedules and demand.

Bright Health Group — Extended the client CRM with configurable questionnaires and rules-driven care-planning workflows, letting healthcare experts automatically generate tailored customer care plans from questionnaire responses.

Internal Hitachi IP — Built a role-based React forecasting application for SOW estimation, with dashboards, chat, configuration tooling, and Excel-like components for rapid data entry. Improved forecast accuracy and delivered ahead of schedule despite a reduction in force on the team.

Loblaw Digital — Front End Developer

September 2021 – April 2022

- Built and maintained a reusable React component library supporting Shoppers Drug Mart’s customer-facing digital experience and its established customer base.
- Translated designs and wireframes into responsive, accessible user interfaces and supported the GraphQL middleware layer.
- Implemented unit, integration, and UI-based tests with React Testing Library, Storybook, and Playwright.
- Addressed Java backend issues as demand required, leveraging prior experience.

Ministry of Education — IT QA Assistant

May 2019 – December 2019

- Automated test cases with Selenium, supporting maintenance of 20 unique applications.
- Wrote SQL scripts to verify and modify data in Oracle databases.
- Produced detailed defect and test-execution reporting, informing release-health evaluation.
- Led knowledge-transfer sessions and mentored new QA employees.

INDEPENDENT PROJECTS

DevIntercept — Windows desktop tool that improves frontend development workflows by intercepting remote browser responses and serving local or development-server content in their place. Supports Vite HMR, so code changes appear on the fly without a full page refresh — enabling local development against deployed environments that would otherwise require a full redeploy cycle.

C# · .NET 8 · WPF · Playwright · Vite HMR · github.com/Chris034/DevIntercept

Cache — No-login, room-based web application for instantly sharing text, links, images, and files between devices or with others. Pairs a React and TypeScript client with Socket.IO real-time messaging, an Express API, and MongoDB persistence, documented through a generated OpenAPI specification.

React · TypeScript · Socket.IO · Express · MongoDB · OpenAPI · github.com/Chris034/cache

Portfolio site — Personal portfolio built and deployed from scratch, with a custom light and dark theme, accessible navigation and semantics, and responsive layouts. Continuously deployed to GitHub Pages.

React · TypeScript · Vite · GitHub Pages · chris034.github.io/portfolio

EDUCATION & CERTIFICATIONS

University of Toronto — Honours Bachelor of Science

2021

Specialist in Statistics (Machine Learning and Data Mining), Co-op Program

Microsoft Certifications — PL-200 · PL-400 · PL-900 · AZ-900
